Parent No. 6552294
GENERAL INFORMATION:
TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragments
TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, prevering RIMERATION: and treatment of infection
FILE REPERENCE: 9710-003-999
CURRENT APPLICATION NUMBER: US/09/198,452A
CURRENT PILING DATE: 1998-11-24
NUMBER OF SEQ ID NOS: 6849

Patent No. 6531648
GENERAL INFORMATION:
APPLICANT: Lenahan, Michael B.
APPLICANT: Deash, Nalini M.
APPLICANT: Gasdaska, Pamela Y.
TITLE OF INVENTION: GRAIN PROCESSING METHOD AND;
TITLE OF INVENTION: THEREIN
FILE REFERENCE: A-3138391
CURRENT APPLICATION NUMBER: US/09/598,747
CURRENT FILING DATE: 2000-06-21
NUMBER OF SEQ ID NOS: 42
SOFTWARE: PatentIn Ver. 2.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 4

Kennebec plants were grown from cuttings on a labr light/8 hr dark cycle at 25 C for 3-4 weeks. Abiotic stress conditions were applied to four separate sets of plants. Set 1 involved saturation of the soil with 150 mm NaCl and tissues were harvested at following application of the salt stress (leaves: 2hr, 6hr, 12hr, and 2d). Set 2 were grown under the standard conditions and then were grown under the standard conditions and sphlications. Drought stressed by withdrawal of further watering applications. Drought stressed blants were harvested after cessation of watering (leaves: 3d, 5d, and 7d; roots:3d and 5d). Set 3 were grown under the standard conditions and then were cold stressed at 2 hr, 6 hr, 12 hr, 1 d, and 4 d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d, and 4 d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d, and 4d and heat-stressed roots were harvested at 6 hr, 12 hr, 1 d, and 4d and heat-stressed roots were harvested at 6 hr, 12 hr, 1 d, and 4d and heat-stressed roots were harvested at 6 hr, 12 hr, 1 d, and 4d and heat-stressed roots were harvested at 6 hr, 12 hr, 1 d, and 4d and heat-stressed roots were harvested at 6 hr, 12 hr, 1 d, and 4d. RNA was isolated from all tissues and equal RNA from each tissue and stress was pooled to construct the cDNA library. RNA sample."

supplier: RNA was isolated from Nicotiana benthamiana
tissues that include callus, roots from liquid culture
grown plants, heat-stressed leaves (38 C, 3 hr and 6 hr),
cold-stressed leaves (5 C 3 hr, 6hr), and pathogen
challenged leaves (Pseudomonas syringae pv tomato 12 hr;
Xanthomonas campestris pv campestris 12 hr, 18hr;
Pseudomonas syringae pv phaseolicola 18hr, and Xanthomonas
campestris pv vesicatoria 18hr). RNA was isolated from
these tissues and pooled in approximately equal molar
amounts."

supplier: RNA was isolated from Nicotiana benthamiana
tissues that include callus, roots from liquid culture
grown plants, heat-stressed leaves (38 C, 3 hr and 6 hr),
cold-stressed leaves (5 C 3 hr, 6hr), and pathogen
challenged leaves (Pseudomonas syringae py tomato 12 hr;
Xanthomonas campestris py campestris 12 hr, 18hr;
Pseudomonas syringae py phaseolicola 18hr, and Xanthomonas
campestris py vesicatoria 18hr). RNA was isolated from
these tissues and pooled in approximately equal molar

/note="Vector: pCWYSport6.1; Site 1: EcoRI; Site 2: Not!;
supplier: Solanum tuberosum var. Kennebec plants were
grown from cuttings on a 16hr light/d hr dark cycle at 25
C for 3-4 weeks. Abloid: Sariess conditions were applied to
the soil with 150 mW NAC1 and tissues were harvested at
following application of the salt stress (leaves: 2hr,
6hr, 12hr, 1d, 2d, and 4d; roots:2hr, 6hr, 12hr, and 2d).
Set 2 were grown under the standard conditions and then
were water stressed by withdrawal of further watering
applications. Drought stressed plants were harvested after
cessation of watering (leaves: 3d, 5d, and 7d, roots:3d
and 5d). Set 3 were grown under the standard conditions
and then were cold stressed by placement at 4 C. Cold
stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d,
and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d,
and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d,
and 4d and the were grown under the standard conditions and
then were hear stressed roots were harvested at 6 hr,
12 hr, 1 d, and 4d. RNA was isolated from all tissues and
equal RNA from each tissue and stress was pooled to
construct the CDNA library. RNA sample."

If you are interested in getting corresponding physical clones, these are publicly available from ZmDB and may be found by BLAST searching at MSL, maizemap.org; ZmDB, www.zmdb.iastate.edu; TIGR, www.tigr.org; or NCBI, www.ncbi.nlm.nih.gov. When the source of Imaize CDNA sequences is either Virginia Walbot, Stanford or Pat Schnable, Iowa State, then clones may be requested from ZmDB: www.zmdb.iastate.edu.
                                                                                                                                                                                                                                                                                                                                                                                                                     /note="this sequence is part of a project of EST assemblies resulting from the application of public contigs to seed DuPont contigs; this resource was assembled by DuPont as part of a collaboration for the overgo addressing of EACs in conjunction with the Maize Mapping Project"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     121 AlaThrGlyAlaValAlaArgArgLeuHisPheProGlySerAspAlaTyrTrpAsnArg

```
a first sequence to regulate transcription, a second DNA sequence encoding a fusion polypeptide, comprising a sequence encoding an oleosin gene and sequence encoding (I) and a third sequence encoding a termination region functional in the host cell and growing the host cell to produce a fusion polypeptide. The method or (I) is useful for expression of a thioredoxin or thioredoxin reductase by a host cell. This sequence encodes Arabidopsis thaliana thioredoxin reductase

```
recombinant polypeptide (P1, P2), where P1 is capable of associating with P2 to form the MPC and associating the complex with an occlusion body (OB) through an OB-targeting-protein capable of associating with OB and P1. M1 is useful for producing an oil body associated with a recombinant MPC. The oil bodies are further formulated for use in the preparation of a food product such as milk or wheat based food product, personal care product which reduces the oxidative stress on the surface area of the human body or used to lighten the skin, or a pharmaceutical composition used to lighten the skin, or a pharmaceutical composition used to tract chronic obstructive pulmonary disease (COPD), cataracts, diabetes, envenomation, bronchlopulmonary disease, psoriasis, malignancies, reperfusion injury, wound healing, sepsis, gastro intestinal (GI) bleeding, intestinal bowel disease (IBD), ulcers GERD (Gastro ossophageal reflux disease). ABN89569 to ABN89593 and ABP60677 to ABR6064 represent sequence given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention

                                                                                                                                                                                                        The invention describes a method of expressing thioredoxin or thioredoxin reductase (I) in the oil body of a host cell using an oil body protein gene. The method involves introducing a chimeric nucleic acid comprising

                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                            The invention describes a method of expressing thioredoxin or thioredoxin reductase (1) in the oil body of a host cell using an oil body protein gene. The method involves introducing a chimeric nucleic acid comprising a first sequence to regulate transcription, a second DNA sequence encoding a fusion polypeptide, comprising a sequence encoding an oleosin gene and sequence encoding (1) and a third sequence encoding an oleosin termination region functional in the host cell and growing the host cell expression of a thioredoxin or thioredoxin reductase by a host cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method (M1) for producing an oil body associated with a recombinant multimeric protein complex (MPC). M1 comprises producing in a cell comprised a first and second recombinant polypeptide (P1, P2), where P1 is capable of associating with P2 to form the MPC and associating the complex with an occlusion body CC (DB) through an OB-targeting-protein capable of associating with OB and P1. M1 is useful for producing an oil body associated with a recombinant MPC. The oil bodies are further formulated for use in the preparation of a food product usuch as milk or wheat based food product, personal care product which reduces the oxidative stress on the surface area of the human body or used to lighten the skin, or a pharmaceutical composition used to reat chronic obstructive pulmonary disease (CDPD), cataracts, diabetes, envenomation, bronchhopulmonary disease, psoriasis, cataracts, intestinal (G1) bleeding, intestinal bowel disease (IBD), ulcers, GERD (Gastro ossophageal reflux disease). ABN89559 to ABN89593 and ABP60677 to ABR60964 represent sequence given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      144
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             204
